I Fully Automated My Video Editing Using Claude Code (Full Walkthrough)

The YouTube editor skill: the Claude Code skill that edits my videos, with the setup guide and every prompt

This is the skill from the video, the one that edits my YouTube videos while I sleep. The zip next to this PDF is the skill itself. This PDF is the short version of how to set it up and run it. The same steps are inside the zip as SETUP.md and PROMPTS.md.

What's in the zip

File or folder	What it is
`youtube-edit/`	The skill. `SKILL.md` is the rulebook Claude reads. `scripts/` are the tools it runs: cutting, the dead-air scan, the animation composer, the render checks and the final assembly. `assets/fonts/` is the font.
`SETUP.md`	Setup, step by step.
`PROMPTS.md`	The exact prompts I type.
`STYLE-GUIDE.md`	My look: colours, font, cards, motion, camera, sound and cuts, with an empty column for yours.
`LICENSES/`	The licences for the font and for the code parts adapted from an open-source starter kit.

The team it replaces

The job	The tool that does it now
The editor	Claude Code, running the skill
The transcriber	Parakeet and auto-editor: where I speak, and every word with its exact time
The animator	HyperFrames: it draws the animations and renders every frame
The researcher	Claude in Google Chrome: the screenshots, articles and posts I mention
The screen editor	Tella: my screen recordings, opened by name
The sound designer	Epidemic Sound: music and sound effects
The finisher	FFmpeg: it joins the pieces and checks the final file

Set it up (about 30 minutes)

1. **Get the Claude desktop app** from claude.com/download. Sign in with Google or an email.
2. **Pick a paid plan.** The $20 plan is enough to set everything up. Full videos use a lot more. I'm on the $200 Max plan.
3. **Open Claude Code**: New, then Claude Code on the left.
4. **Four settings**: Local (it works on your computer), your folder (create one, for example "Video Editing"), permissions on Auto, and the latest model for the setup.
5. **Turn on the browser**: Settings, Claude Code, the browser setting. The skill uses it to find what you talk about.
6. **Connect your tools**: Customize, Connectors. Tella if you record your screen with it, Epidemic Sound if you use it for music. Both are optional.
7. **Install the skill.** Unzip the folder into your project folder and type:

> Install the youtube-edit skill from the WeAreNoCode-YouTube-Editor folder into this project's .claude/skills folder. Then check everything it needs, install what's missing, and run its tests.

Claude installs FFmpeg, HyperFrames, auto-editor, Parakeet and a few Python packages itself. When the tests pass, open a new thread. Skills load at the start of a thread.

Run it

Start with a 30 to 60 second hook. Drop the raw clip in and type:

> Please use my YouTube editing skill to edit this hook for my YouTube video.

Add what you know about the clip. Mine, from the video:

> When I say things like zoom, show a zoom. When I talk about a sound effect, add the sound effect. When I talk about the different animations, show three of the most impressive animations from the library inside the skill.

A hook takes 10 to 20 minutes. For a full video, list your clips in order and name your Tella recordings:

> Please use my YouTube editing skill to edit this full video. The raw clips are [file names], in this order. I also recorded [number] screen recordings in Tella called [names].

Give notes, then make it learn

Watch the whole version first. Then go through it with timestamps, in plain words:

> At second 22 you did this. I'd like it to be like that.
> Around second 14 there's a quick flash. That's a mistake. Please take it out.
> This is way too busy, and most of these sounds make no sense.

After every round, the prompt that matters most:

> Can you learn from what we did and add it to the skill?

That's how mine learned. Every rule in the skill came from a note like these.

Make it look like yours

The first version will look like my channel. Fill in the "Yours" column in STYLE-GUIDE.md, then:

> Here's my style guide. Update the youtube-edit skill to match it.

Record so it edits well

- 4K if you can. Zooms stay sharp. 1080p goes soft past about 112%.
- Mess up a line? Pause and say it again. It keeps your last take of every line.
- Keep the file flat: no zooms, captions or transitions baked in.

Licences

The font is DM Sans (SIL Open Font License). Some scripts started from an open-source starter kit under the MIT License. Its notice ships in LICENSES/. No music, sound effects, footage or logos come with the kit. Use your own, or ones you have the rights to.
